
Integrated reasoning-action
ECoT
OneTwoVLA
Reasoning / spatial state
Action tokens / action chunk
Action decoding / robot controller
Observe and steer through exposed inputs
Skill / policy invocation
SayCan
Hi Robot
Task-level selection
Skill / subgoal + scene bindings
Callable policy / motion primitive
Monitor or terminate; check actor handoffs
Programmatic orchestration
CaP
DROC
Program generation
Executable code Loops / branches
Perception, planning and control APIs
API / assertion checks; optional code revision
Spatial objectives and constraints
VoxPoser
ReKep
Objective specification
3D value maps / keypoint constraints
Motion optimizer / robot controller
Replan from state; check scene registration
Incremental commands
Show-Harness
WAA
Next-step decision
Pose / delta / gripper command
Interpreter / feedback controller
New views / reports; adjust the next step
Shared runtime: grounding / sensing, state tracking, verification, recovery and coordination.
Report latency, action horizon, interruption points and the motor feedback retained below the interface.
Execution
Feedback
Interfaces may combine. Runtime recovery does not by itself establish retained improvement.
